

Catch Eye Smart - Real-time Remote Video Solution

Catcheye Smart is a real-time remote video solution developed to minimize the time required for emergency measures and on-site support in times of service failure or equipment malfunction. The solution supports interactive video communication between the control center (transmission room) and the site of incident by using the existing network infrastructure (LTE) and smart devices (smart phone, tablet PC, etc.), thus removing the need for a massive scale of new investment. Activated through the device's video telephony feature, it enables the control tower to accurately determine the situation and take necessary measures to minimize damage and recovery time. The solution also supports multi-user video calling to allow all relevant parties to participate in the recovery process.
